Mussel prevention war grinds on in the Okanagan

The Okanagan Basin Water Board has been leading the charge for more than ten years

By J.P. SQUIRE

Okanagan Newspaper Group

The Okanagan Basin Water Board is hoping for the best but preparing for the worst in its ongoing battle against invasive mussels making their way into the big lake.

The board will launch its 10th annual Don't Move A Mussel campaign in the spring, encouraging residents – especially those returning with watercraft from other jurisdictions, or planning to purchase used watercraft from invasive mussel-infested regions – to contact the province's Invasive Mussel Defence program regarding an inspection, said communications director Corrine Jackson.

At their first meeting of 2023, board members learned that resources for invasive mussel vulnerability (a toolkit) is in development by Renata Claudi, an environmental scientist, from Ontario-based RNT Consultants. "We will also be looking to reach visitors coming to the Okanagan with watercraft," Jackson said. "Our intention is to have the toolkit ready at the same time. Over the years, we have worked closely with the province and many others to help prevent the introduction of these mussels into B.C. waters and are looking forward to providing local governments and utilities with a toolkit to deal with them, as best as possible, if they end up here."

If invasive mussels should get into the Okanagan, this toolkit will help local water utilities, fisheries, farmers, whoever has in-water infrastructure to understand what the risks to their facility are and also to look at ways

that they can mitigate or prepare in advance to mitigate potential damage and increased operating costs," said OBWB deputy administrator James Littlely.

There could be several ways to mitigate the impact, depending on what the facility looks like, he added.

"Just as a fairly simple example, let's say you have a water intake in a chlorinated water delivery system right now. Currently, what would typically happen is you'd have this long water intake pipe into the lake with maybe a primary filter on the end of it. But the chlorination and all of the treatment would happen in the facility."

Changing that would require a new approach, Littlely said.

"One of the potential things you could do is move the chlorination point – or at least an initial chlorination point – out to the intake so that as water goes in, it's instantly chlorinated and that would kill any larvae before they would enter into the whole system. That's just one example."

However, it would not be cheap. Larratt Aquatic estimated outfitting one intake could cost at least \$25,000, depending on whether

chlorine is already present at the pump house, plus the cost of chlorine. Currently more than two-third of intakes in Okanagan lakes do not use chlorine.

Another alternative could be twinning those intakes so one can be shut down for cleaning, said Littlely. Another might be using different types of materials such as titanium that mussels can't attach to. "So there are a number of potential options just to prepare your system, and really control how and where you have to interact with the mussels," said Littlely.

According to the Invasive Species of B.C. website, both species have been found as deep as 110 metres but zebra mussels prefer depths of two to 12 metres while quagga mussels prefer depths of 10 to 13 metres. The City of Kelowna's intake at the Poplar Point Pump Station, for example, is in 29 metres of water in Okanagan Lake.

The toolkit will include a section on mussel biology, said Littlely. "It will tell facility managers exactly where they have to be concerned. But even if the mussels wouldn't attach to that intake at 90 feet deep, the larvae could

potentially still get in there because they are just microscopic and they float around in the water," he added. "So you could be sucking them in even when they're not adults. And then, once they get into the facility, they start to form shells and attach inside the pipes."

He anticipates the toolkit will be ready for distribution this year, coinciding with the start of the annual Don't Move A Mussel campaign. It will also be publicly available.

An assessment by Larratt Aquatic in 2013 estimated Okanagan Lake infestations could cost \$42 million a year for at least the first few years.

This includes direct costs such as facilities management and lost revenues. This figure is in line with research in other jurisdictions.

The cost estimate was as much as \$500 million a year to the broader Pacific Northwest region. Those figures have not been updated since 2013.

At this point, Littlely is not sure what the province has planned for its Invasive Mussel Defence program inspection stations for 2023 although officials are currently looking at hiring auxiliary inspectors.

The Okanagan WaterWise program established the Don't Move A Mussel campaign in 2013 to create public awareness of the threat and the board also lobbied the province for the inspection stations which launched in 2015, said Jackson.

"We have also been lobbying the federal government to do more, recognizing the potential impact to fisheries and more. And we provide funding to the Okanagan and Similkameen Invasive Species Society to extend our outreach to boaters and others."

FUND-RAISING

Vancouver is a hot spot for political donations

By KAYLA ZHU

& MICHAEL WONG

The Canadian Press

VANCOUVER — The city of Vancouver provided lucrative territory for federal political party fundraisers during the five years after the 2015 election, suggests a new analysis of Elections Canada political donations data.

The riding of Vancouver Quadra ranked sixth for total donations nationwide, contributing \$3.3 million to federal political parties in the years following the Liberals' sweeping 2015 election victory through the end of 2020. This was substantially more than the national average of about \$853,000, according to an analysis by the Local News Data Hub at Toronto Metropolitan University and the Investigative Journalism Foundation, a non-profit journalism startup tracking political donations and lobbyist activity in partnership with scholars from Canadian universities.

Among the country's 338 electoral districts, Vancouver Centre ranked eighth, with \$2.7 million in total donations greater than

\$200 to federal political parties, electoral district associations and 2019 election candidates.

The riding of West Vancouver—Sunshine Coast—Sea to Sky Country was ninth with \$2.6 million, and Vancouver Granville was 14th with \$2.3 million.

Affluent ridings in major cities, especially those represented by higher-profile politicians, dominated the top of the list.

Among the reasons for the Vancouver ridings' high rankings:

• Donors dug deep: The average donation in Vancouver Quadra was \$1,245. The average in the three other ridings ranged between \$1,063 and \$1,138. By comparison, the national average for all ridings was \$831.

• More people donated: The number of donors in the Vancouver ridings was more than two times higher than the national average of 971 donors, or 119 per 10,000 registered voters.

On the high end in Vancouver, 2,620 people donated in Vancouver Quadra or 345 out of every 10,000 registered voters.

Vancouver Granville, with 2,087 contributors, or 251 per 10,000 vot-

ers, was on the lower end.

The Conservative Party was the main beneficiary of donor largesse in West Vancouver—Sunshine Coast—Sea to Sky Country, drawing \$1.3 million, or 50 per cent of total donations.

The Liberal Party pulled in the most money in the three other ridings, with contributions ranging from about \$1 million to \$1.6 million.

Nationally, Ottawa Centre led
